

Product Specification Sheet

Custom Church Banners

Custom Church Banners run on two materials built for two different environments. PVC Flex vinyl (a smooth, glossy surface) handles outdoor building mounts, while polyester fabric (soft, matte, and naturally draped) covers indoor sanctuary displays. Both carry full-color CMYK printing and ship within the standard production window.

Material

PVC Flex vinyl. Smooth and glossy, holds ink through heat, humidity, and direct sun. Polyester fabric is soft and matte, drapes naturally with no glare under indoor lighting.

Print Method

Eco-solvent or UV inkjet for vinyl. Dye sublimation for fabric, where ink absorbs into fibers so the image will not crack or wash out.

Color Output

CMYK full color. Reproduces most brand colors, scripture graphics, and photographic images within the standard color gamut.

Finishing

Grommets (brass, every 2 ft), pole pockets, or hem and heat weld. Match your finishing choice to your mounting location before ordering.

Size Range

Vinyl runs 2 ft x 3 ft and up. Fabric runs up to 10 ft wide. Banners over 10 ft in width or height include a welded seam for structural strength.

Indoor/Outdoor Rating

Vinyl is rated for both indoor and outdoor use, holding color roughly 6 to 12 months outdoors. Fabric suits indoor use and handles light outdoor exposure only.

Single/Double-Sided

Single-sided is standard. Double-sided uses a blockout liner (a white layer between front and back prints) to stop rear-image show-through.

Weight

Vinyl runs 11 oz for indoor and light-duty outdoor use or 16 oz for heavy-duty outdoor mounting. Fabric runs at 230 GSM (grams per square meter), draping smoothly without bunching.
